Mind the Gap
Leaping from Prospective to Contingent
Resources – A Case Study
Presented by: Steve Phillips
Ryder Scott Petroleum Consultants

INTRODUCTION – TREASURE ISLAND

- You have a map of an island somewhere...
- Said to hold one or more buried treasure chests
- Talk in the tavern – maybe up to ten!
- Found another likely island, crew starts digging
- Previous five islands barren – mutiny in the air
- A shovel hits a buried box, excitement spikes
- When opened – a few coins and trinkets
- Disappointing, but you found something!
- How do you keep crew digging, but avoid being hung?

- Maturation of resource volume is vital to any E&P company
- Managing the transition from Prospective Resources to Contingent Resources is an exercise in credibility
- Internal (crew): exploration vs. production departments
- External (ship owners): investors, partners, governments
- The big question – How do you quantify a discovery to avoid:
 - Over-promising?
 - Missing opportunity?

Nothing here about seismic

2.1.1 Determination of Discovery Status

2.1.1.1 A discovered petroleum **accumulation** is determined to exist when one or more exploratory wells have established through **testing, sampling, and/or logging** the existence of a significant quantity of potentially recoverable **hydrocarbons** and thus have established a **known accumulation**. **In the absence of a flow test or sampling**, the discovery determination requires confidence in the presence of hydrocarbons and evidence of producibility, which may be supported by suitable producing **analog**s (see Section 4.1.1, **Analog**s). In this context, “significant” implies that there is evidence of a sufficient quantity of petroleum to justify estimating the in-place quantity demonstrated by the well(s) and for evaluating the potential for commercial recovery.

Does not allow for absence of drilling and logging

Figure 1.1—Resources classification framework

Source: Petroleum Resources Management System, June, 2018

DISCOVERY – DIFFICULT TO APPLY IN PRACTICE

- Example from real project
- Altered, conceptual sketches, no actual data
- No specific volumes
- Illustrates problems when technical estimates lack definitional framework
- Recommendation for maturing undiscovered volumes

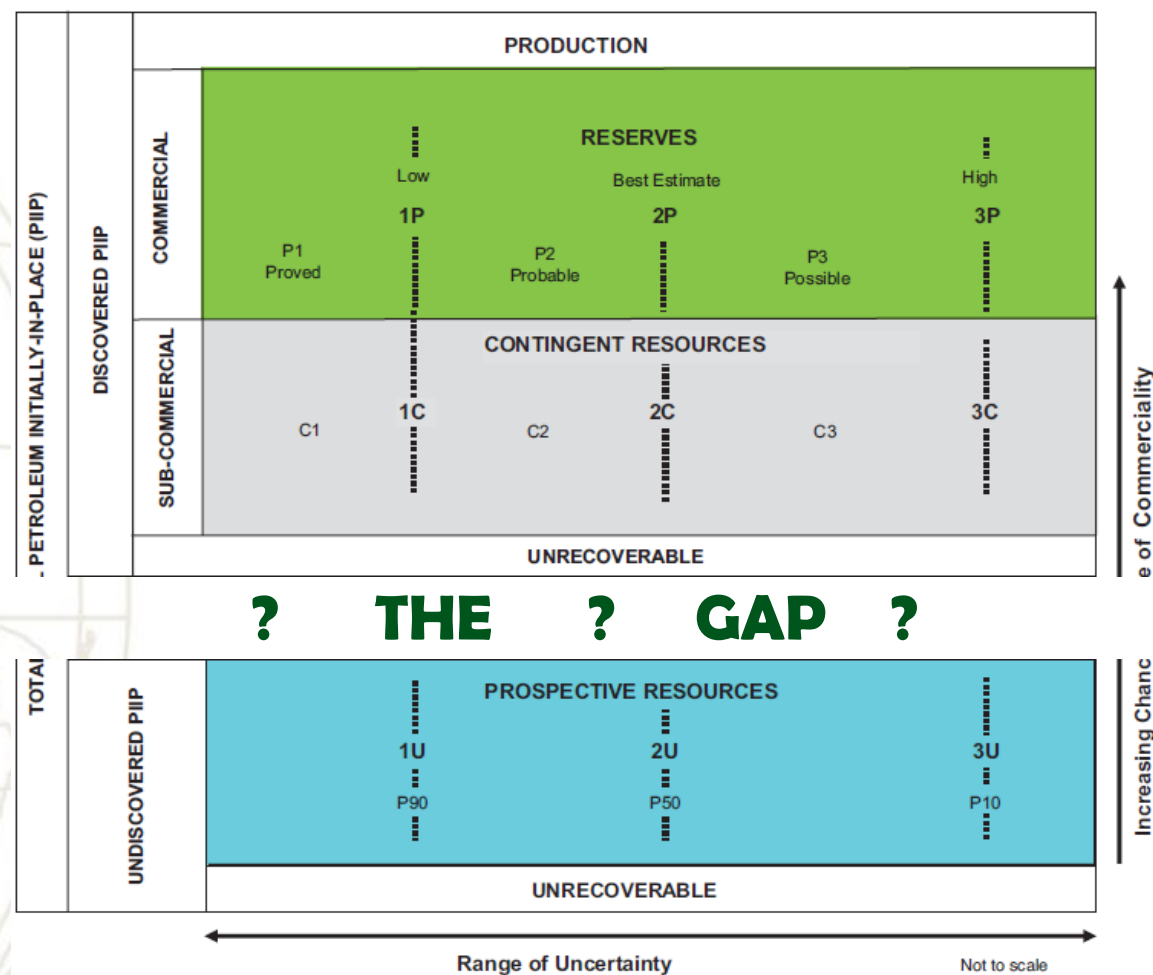

Figure 1.1—Resources classification framework

Targeting the high side of known fields

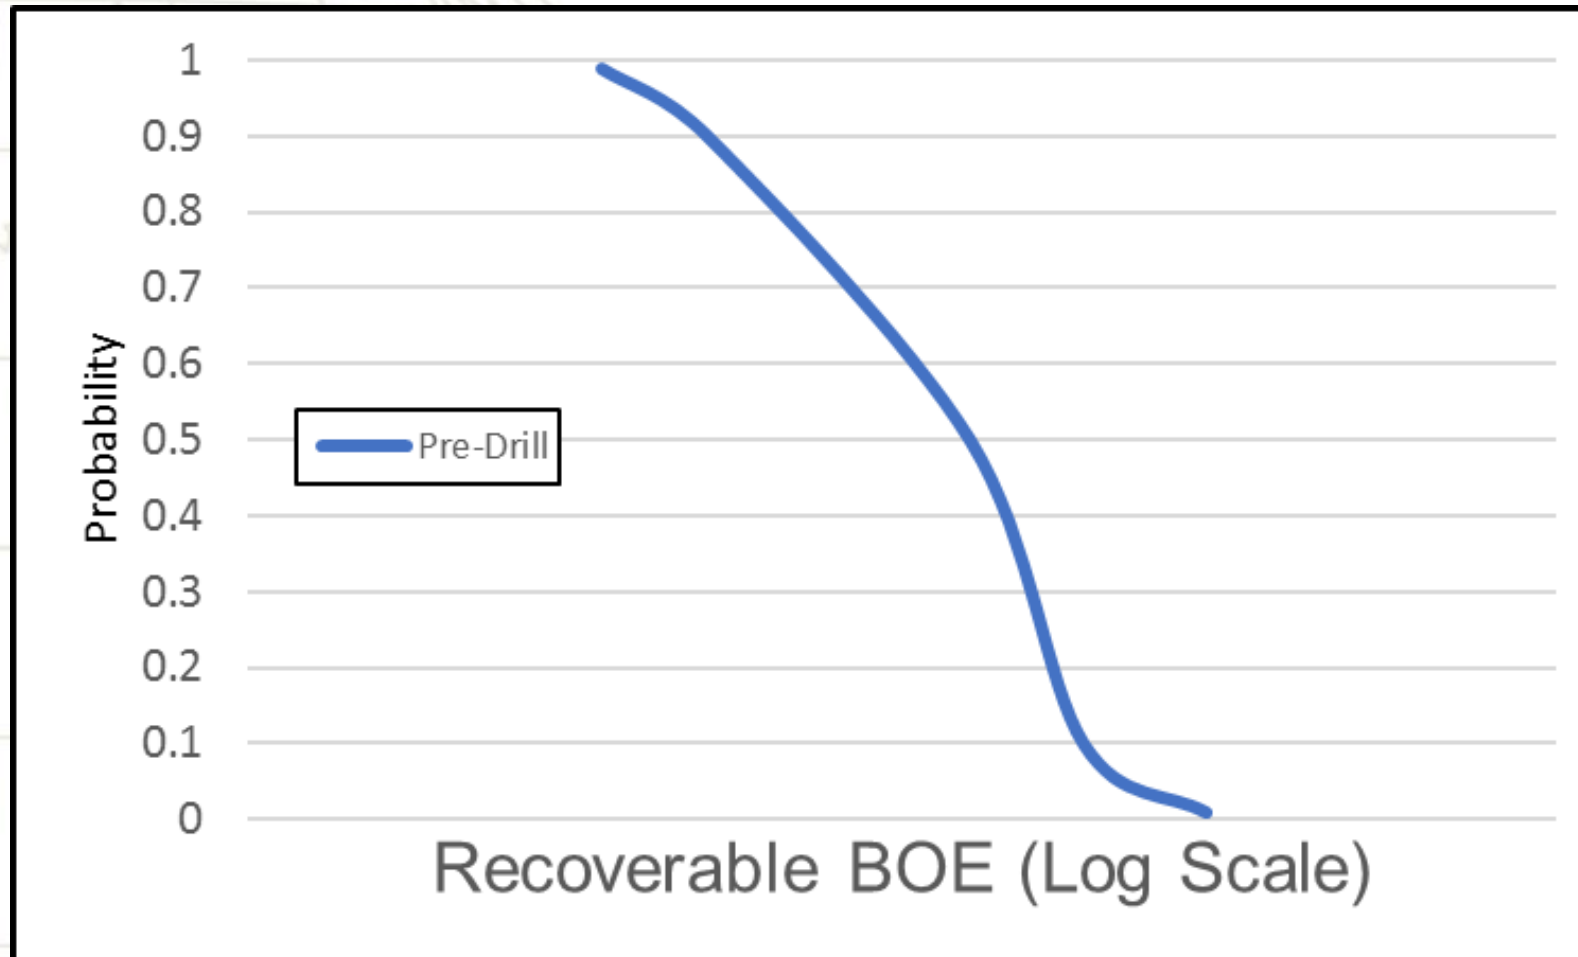

SKETCH OF SEISMIC PROFILE OVER PROSPECT

Structure map on anticipated closure

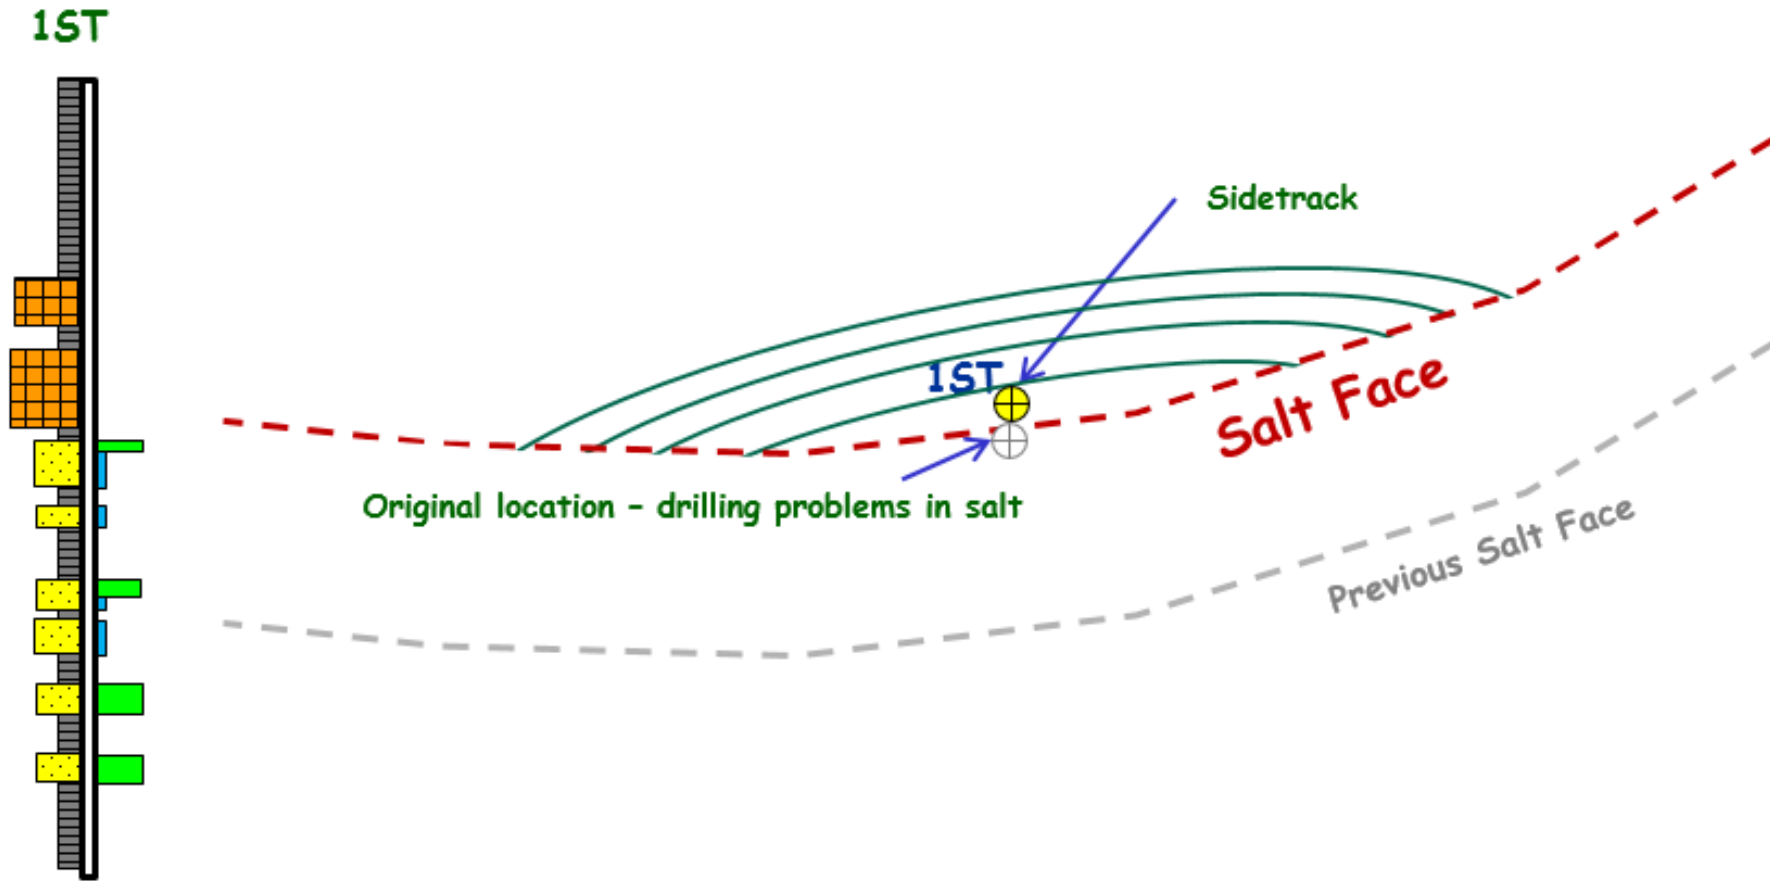

COMPANY PRE-DRILL RESOURCE ESTIMATE

RESULTS OF FIRST WELL – INTERESTING....

Original borehole hit salt, then sidetracked

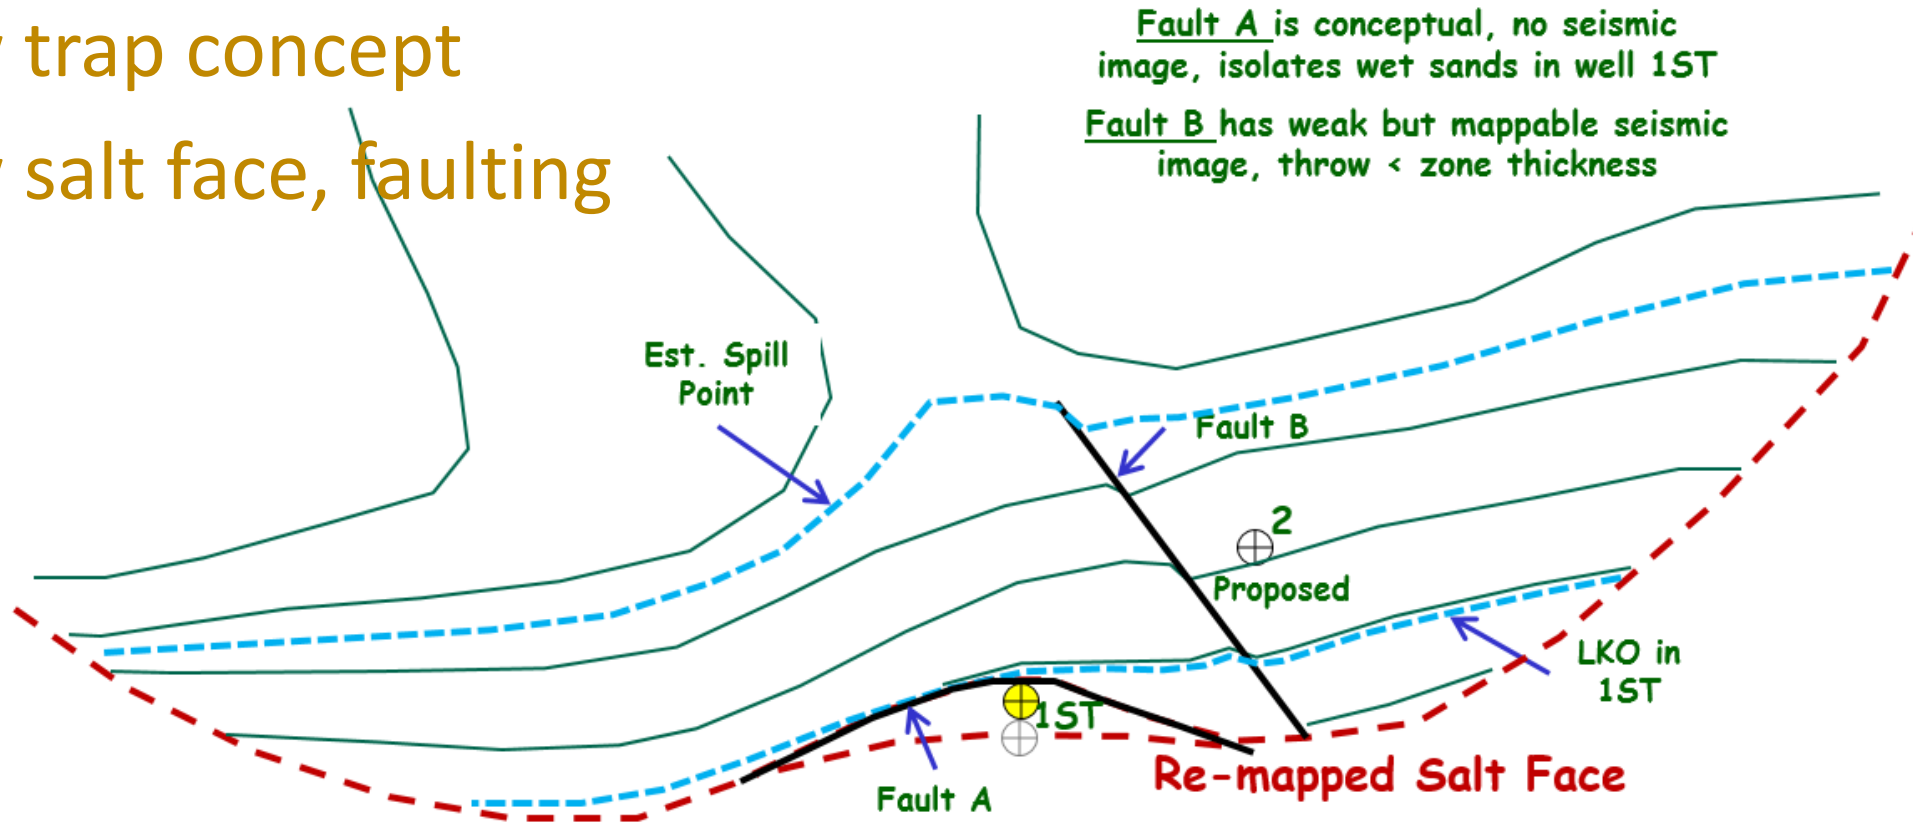

ESTIMATE AFTER FIRST WELL

Is increase in low-side justified?

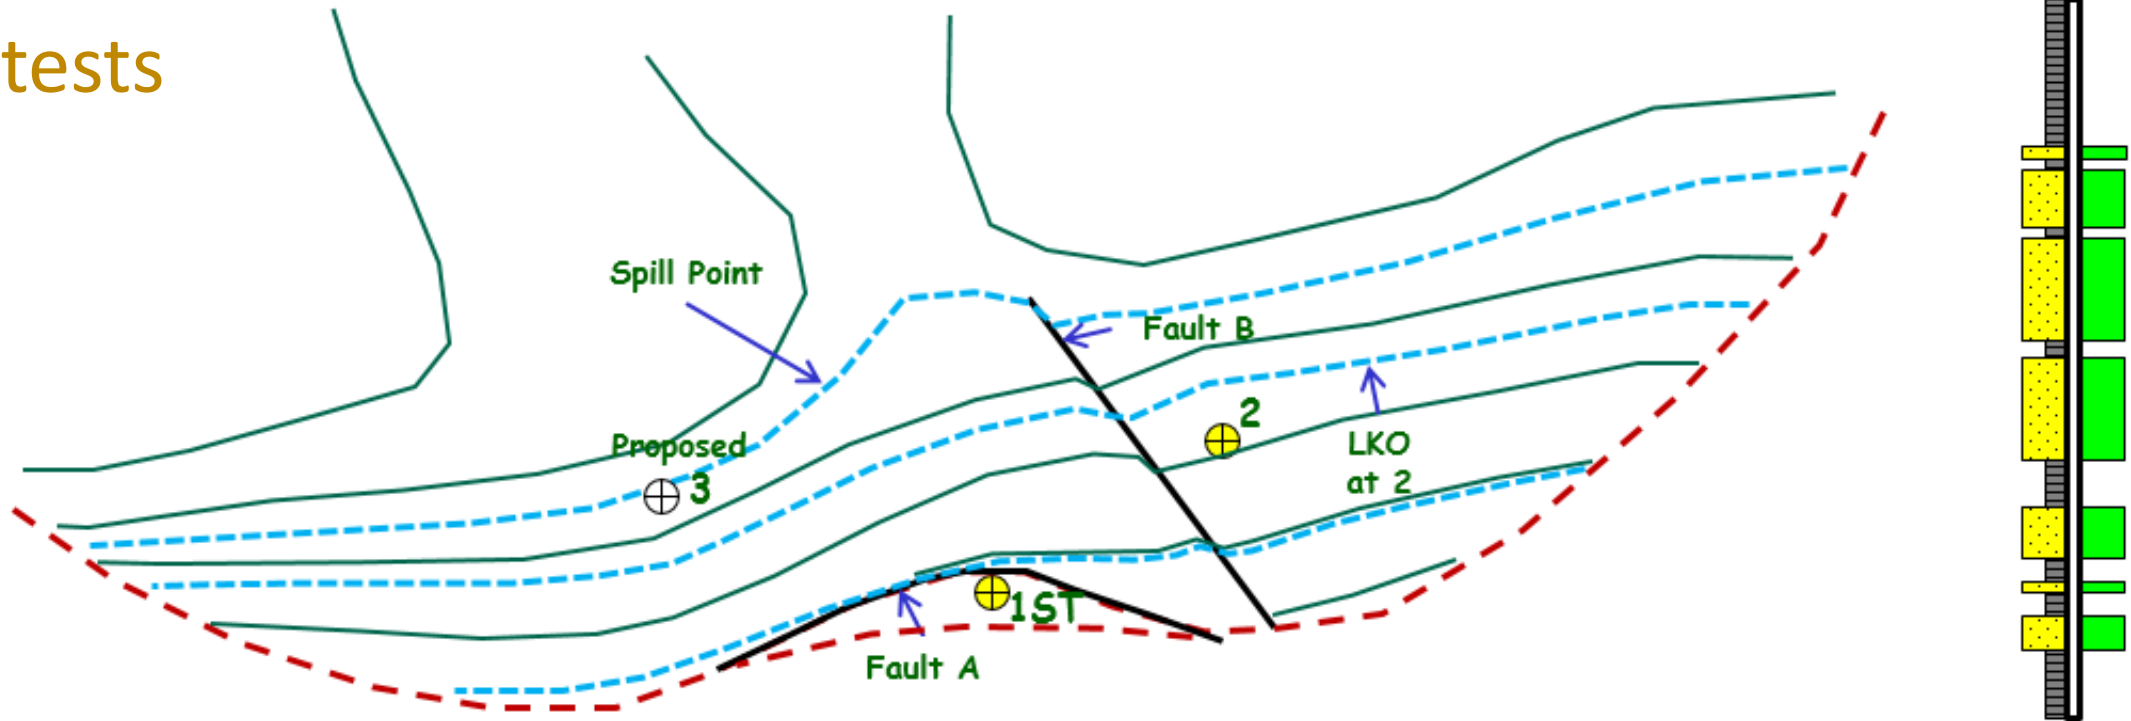

FOUR YEARS LATER....

- Seismic reprocessed, remapped
- New trap concept
- New salt face, faulting

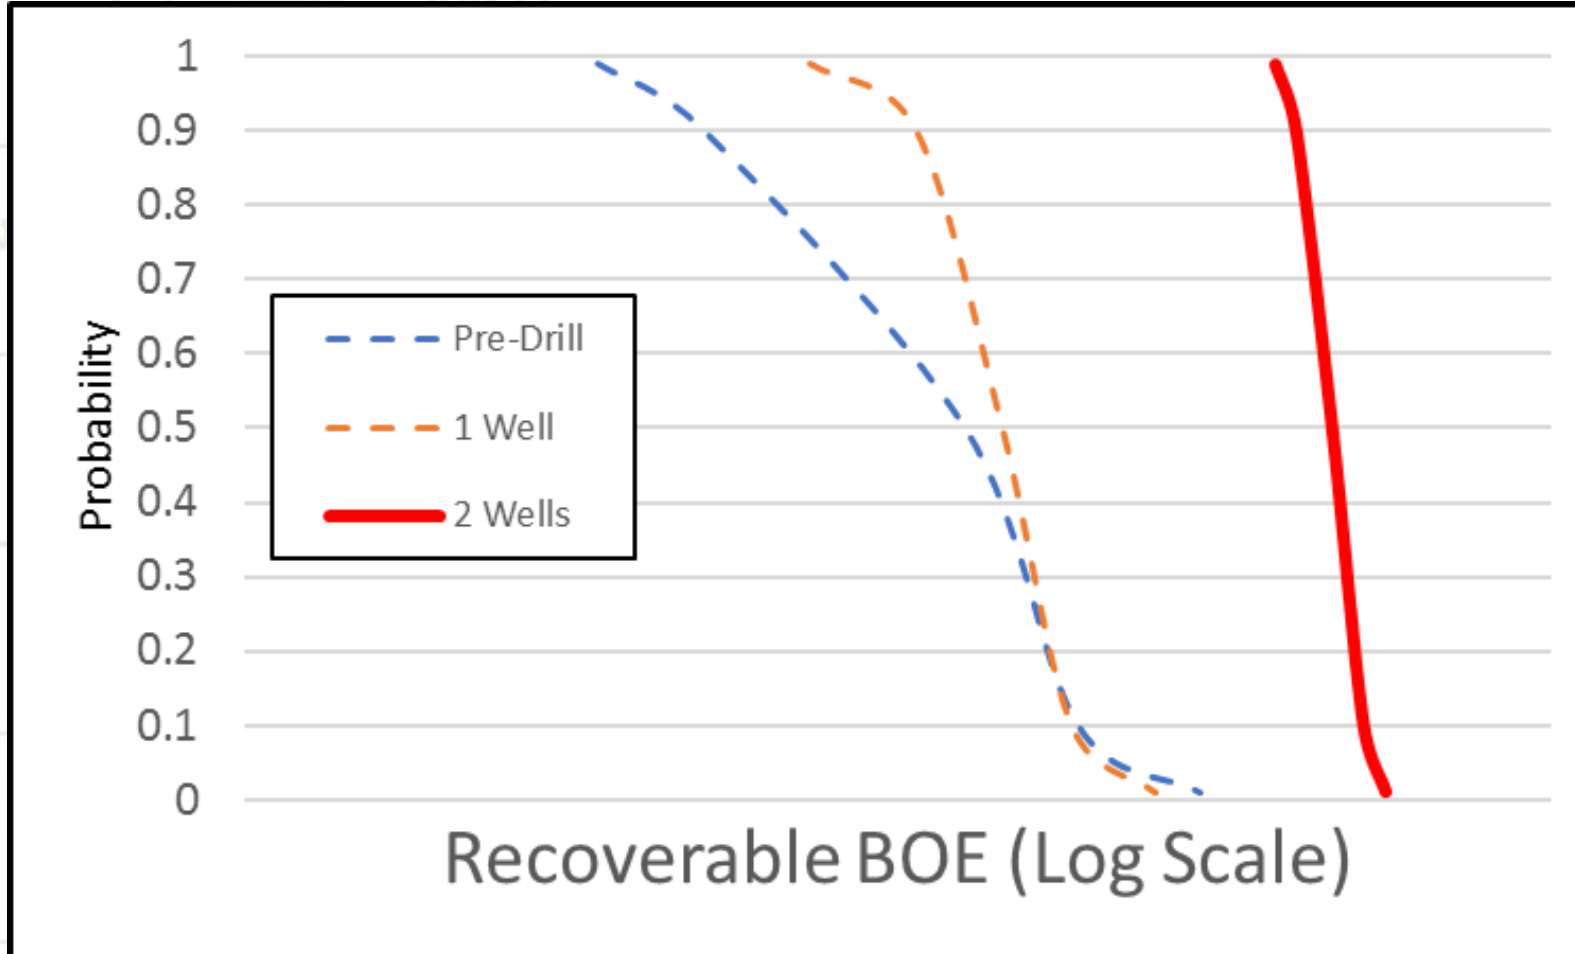

RESULTS OF SECOND WELL - SUCCESS!

- Well 2 finds multiple pay zones, no water, no salt
- New data – logs, cores, pressures, samples, LKO
- No tests

ESTIMATE AFTER SECOND WELL

Reasonable basis, but does not anticipate reserves categories

- Well 3 located to target oil-water contact
- While drilling – new geophysical data revises structure
- Well deviated up-dip

RESULTS OF THIRD WELL – INTERESTING AGAIN

- Well 3 finds sands correlative with Well 2
- All sands wet, highest-known water established

WELL 3 STORY – PART ONE

WELL 3 STORY – PART TWO

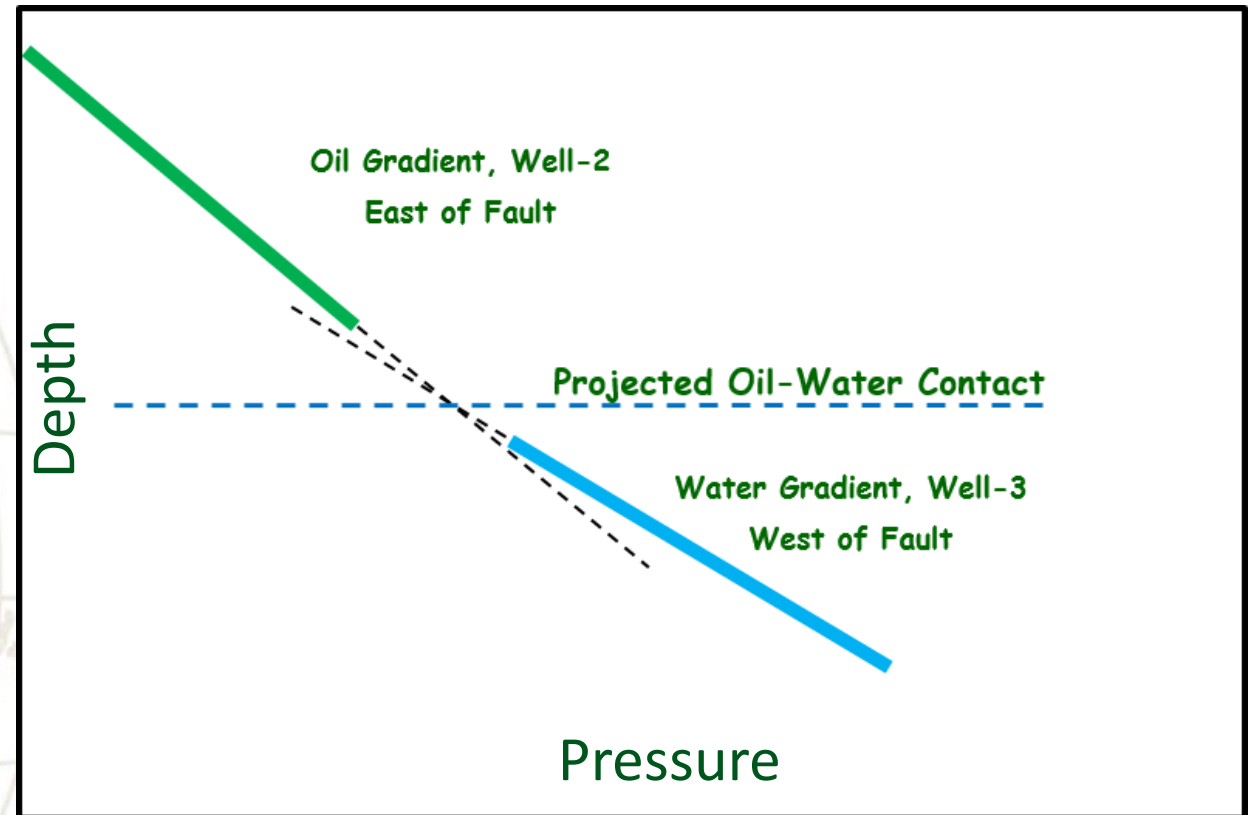

Moral of the story....
Caution advised when
declaring extent of a
discovery.

MORE DATA, MORE QUESTIONS

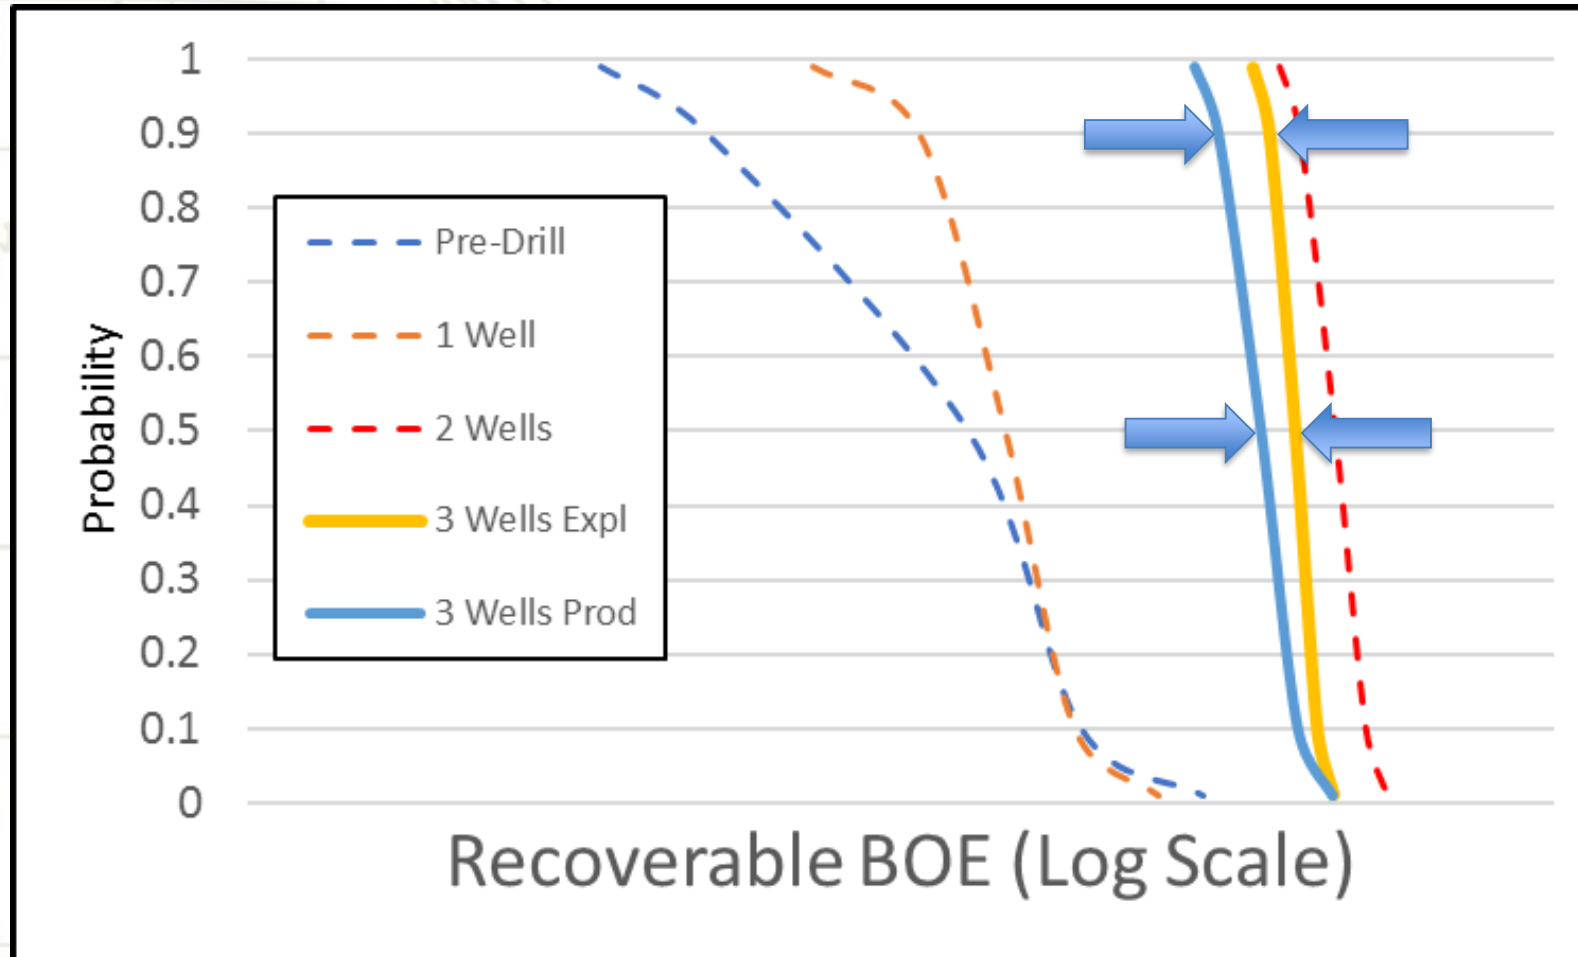

- Oil and water pressure gradients observed on opposite sides of fault
- Does the projected OWC make the Well 3 area discovered?

Caution should be exercised in assigning Reserves to adjacent reservoirs isolated by major, potentially sealing faults until this reservoir is penetrated and evaluated as commercially mature and economically productive. Justification for assigning Reserves in such cases should be clearly documented. Reserves should not be assigned to areas that are clearly separated from a known accumulation by non-productive reservoir (i.e., absence of reservoir, structurally low reservoir, or negative test results); such areas may contain Prospective Resources.

PRMS, 2018, Table 3

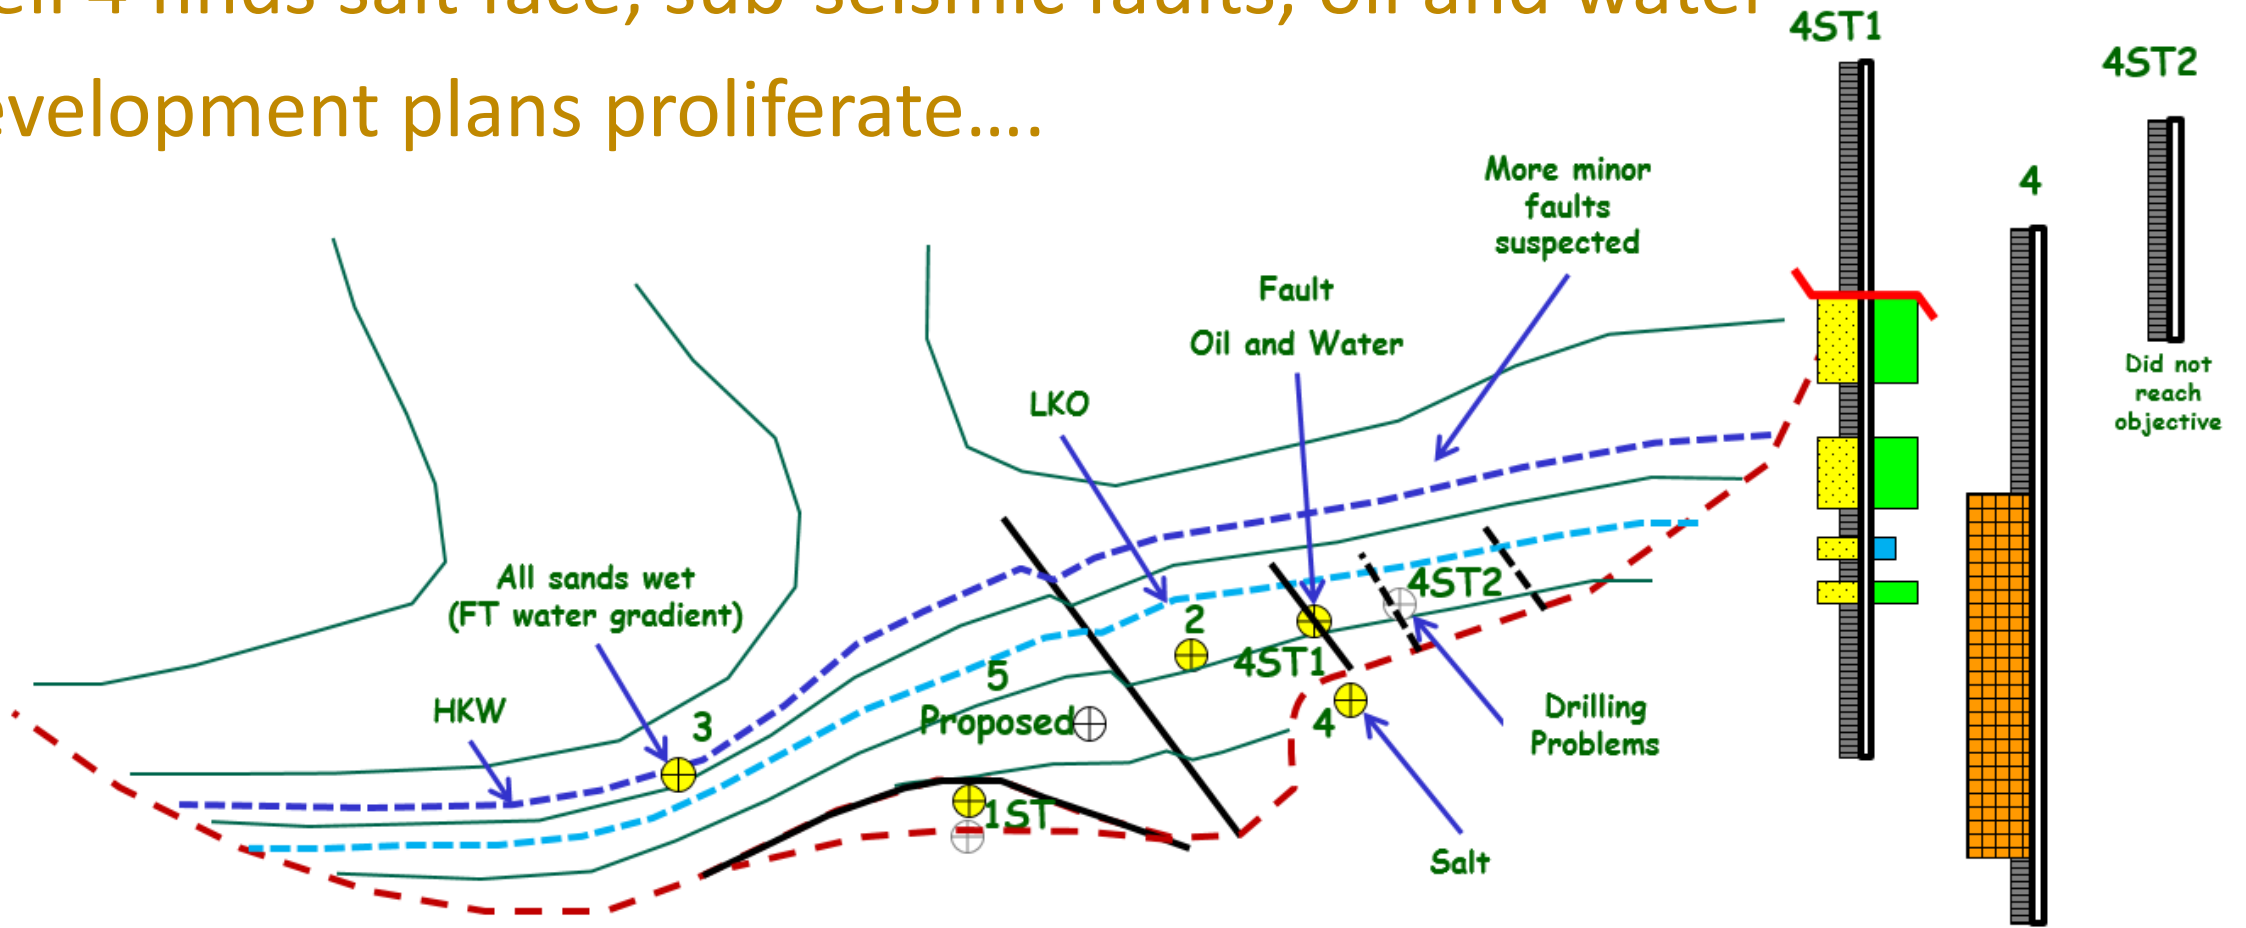

Conflicting metrics?

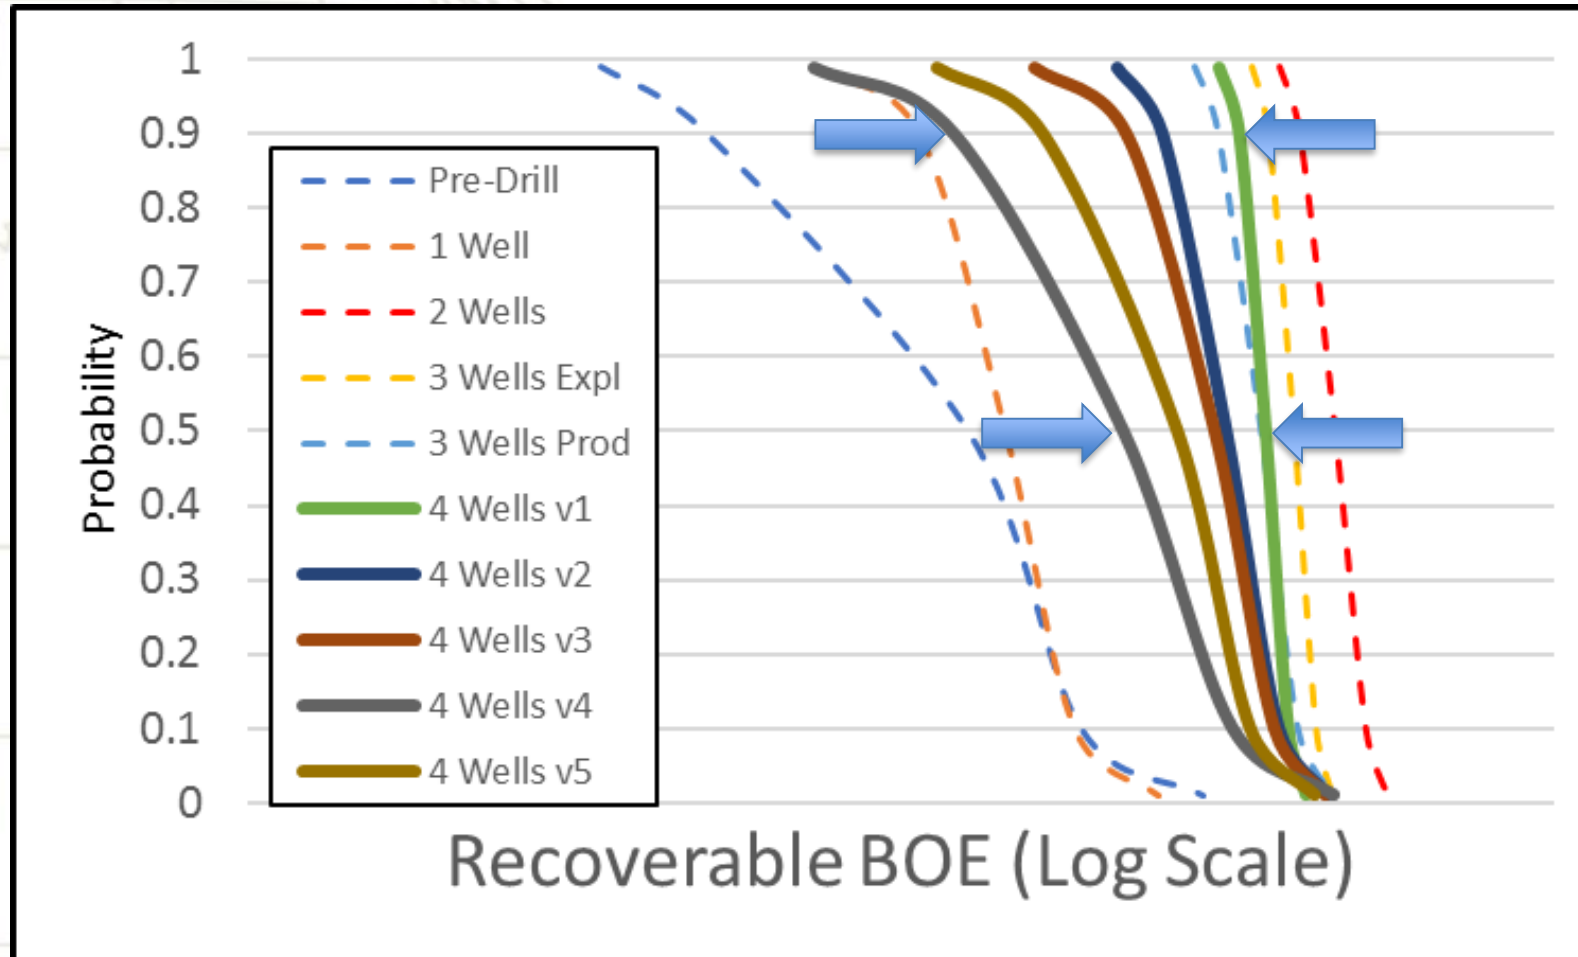

RESULTS OF FOURTH WELL – ENOUGH INTEREST ALREADY!

- Well 4 finds salt face, sub-seismic faults, oil and water
- Development plans proliferate....

Good technical work unsupported by definitional framework

Prospective Resources

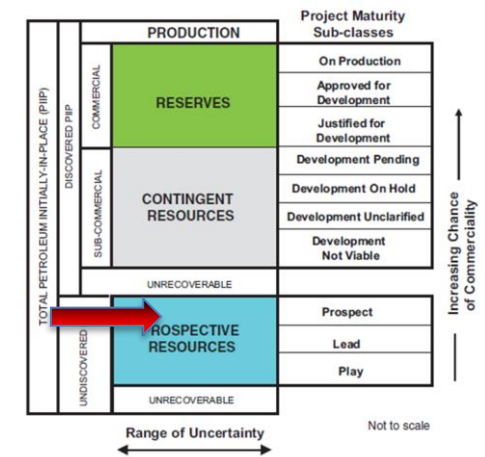

Figure 2.1—Sub-classes based on project maturity

Discovery? Yes, but geological model not valid for future wells

2.1.1.2 Where a discovery has identified recoverable hydrocarbons, but is not considered viable to apply a project with **established technology** or with **technology under development**, such quantities may be classified as **Discovered Unrecoverable** with no Contingent Resources. In future evaluations, as appropriate for petroleum resources management purposes, a portion of these unrecoverable quantities may become recoverable resources as either commercial circumstances change or technological developments occur.

		Project Maturity Sub-classes	
		Commercial	Sub-commercial
TOTAL PETROLEUM INITIALLY-IN-PLACE (PIIP)	DISCOVERED PIP	PRODUCTION	On Production
		RESERVES	Approved for Development
	SUB-COMMERCIAL	CONTINGENT RESOURCES	Justified for Development
			Development Pending
UNDISCOVERED PIP	UNRECOVERABLE	Development On Hold	
		Development Unclassified	
		Development Not Viable	
		UNRECOVERABLE	Prospect
		PROSPECTIVE RESOURCES	Lead
		UNRECOVERABLE	Play

↑ Increasing Chance of Commerciality

Range of Uncertainty

Not to scale

Figure 2.1—Sub-classes based on project maturity

AN UNDER-UTILIZED CLASSIFICATION?

- Discovery of a Petroleum System confirmed (source, reservoir, trap, charge).
- No viable project with established or developing technology or any foreseeable price environment.
- Driven by subsurface reality. More data needed?
- The framework was designed to move petroleum discoveries from prospective to reserves.
- In circumstances where no further development is planned, a path needed to allow these items to exit the framework.
- SPE-PRMS accommodates this with potential to classify as **Discovered Unrecoverable**.

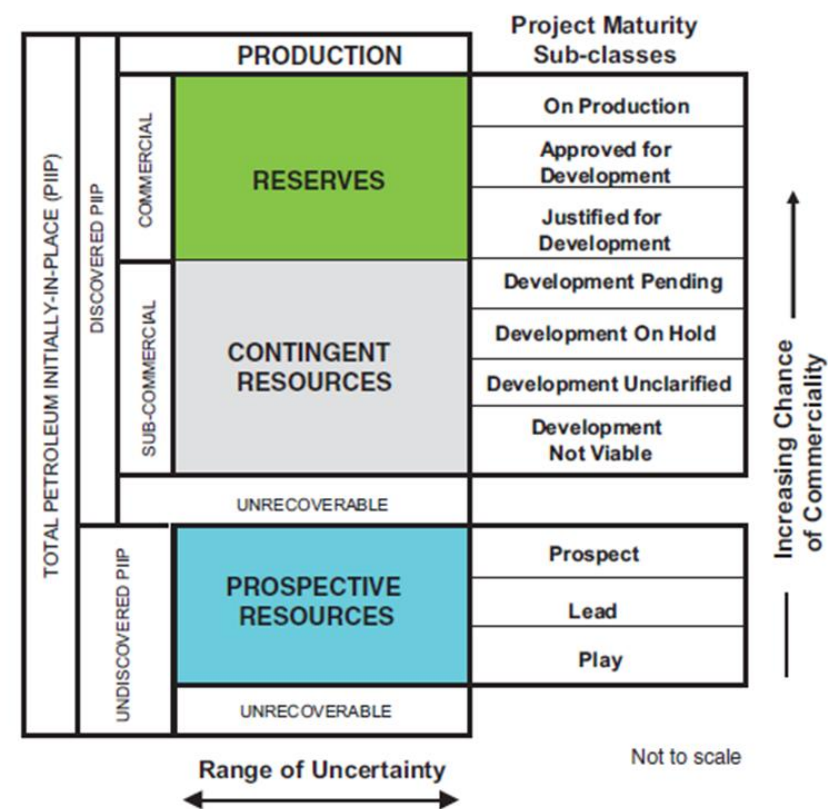

Figure 2.1—Sub-classes based on project maturity

AFTER REMAPPING

- Prospective resources estimated for entire area: 1U, 2U, 3U
- Area penetrated by Well 1 excluded from estimate
- Probabilistic method

		TOTAL PETROLEUM INITIALLY-IN-PLACE (PIIP)		Project Maturity Sub-classes		
		DISCOVERED PIP	UNRECOVERABLE	RESERVES	CONTINGENT RESOURCES	UNRECOVERABLE
COMMERCIAL	PRODUCTION			On Production		↑ Increasing Chance of Commerciality
	RESERVES			Approved for Development		
SUB-COMMERCIAL				Justified for Development		
	CONTINGENT RESOURCES			Development Pending		
				Development On Hold		
				Development Unclassified		
UNDISCOVERED			UNRECOVERABLE			
	PROSPECTIVE RESOURCES			Prospect		
				Lead		
			UNRECOVERABLE		Play	

Range of Uncertainty ← → Not to scale

Figure 2.1—Sub-classes based on project maturity

AFTER SECOND WELL

- Area east of fault recommended for Contingent – Unclarified
- Probabilistic, associated with defined physical areas
- Area west of fault has not been discovered – remains Prospective

TOTAL PETROLEUM INITIALLY-IN-PLACE (PIIP)		Project Maturity Sub-classes	
DISCOVERED PIP	COMMERCIAL	PRODUCTION	On Production
	SUB-COMMERCIAL	RESERVES	Approved for Development
		CONTINGENT RESOURCES	Justified for Development
UNDISCOVERED	SUB-COMMERCIAL	UNRECOVERABLE	Development Pending
		UNRECOVERABLE	Development On Hold
	UNRECOVERABLE	UNRECOVERABLE	Development Unclassified
UNDISCOVERED	UNRECOVERABLE	PROSPECTIVE RESOURCES	Development Not Viable
		UNRECOVERABLE	Prospect
		UNRECOVERABLE	Lead
UNRECOVERABLE	UNRECOVERABLE	Play	

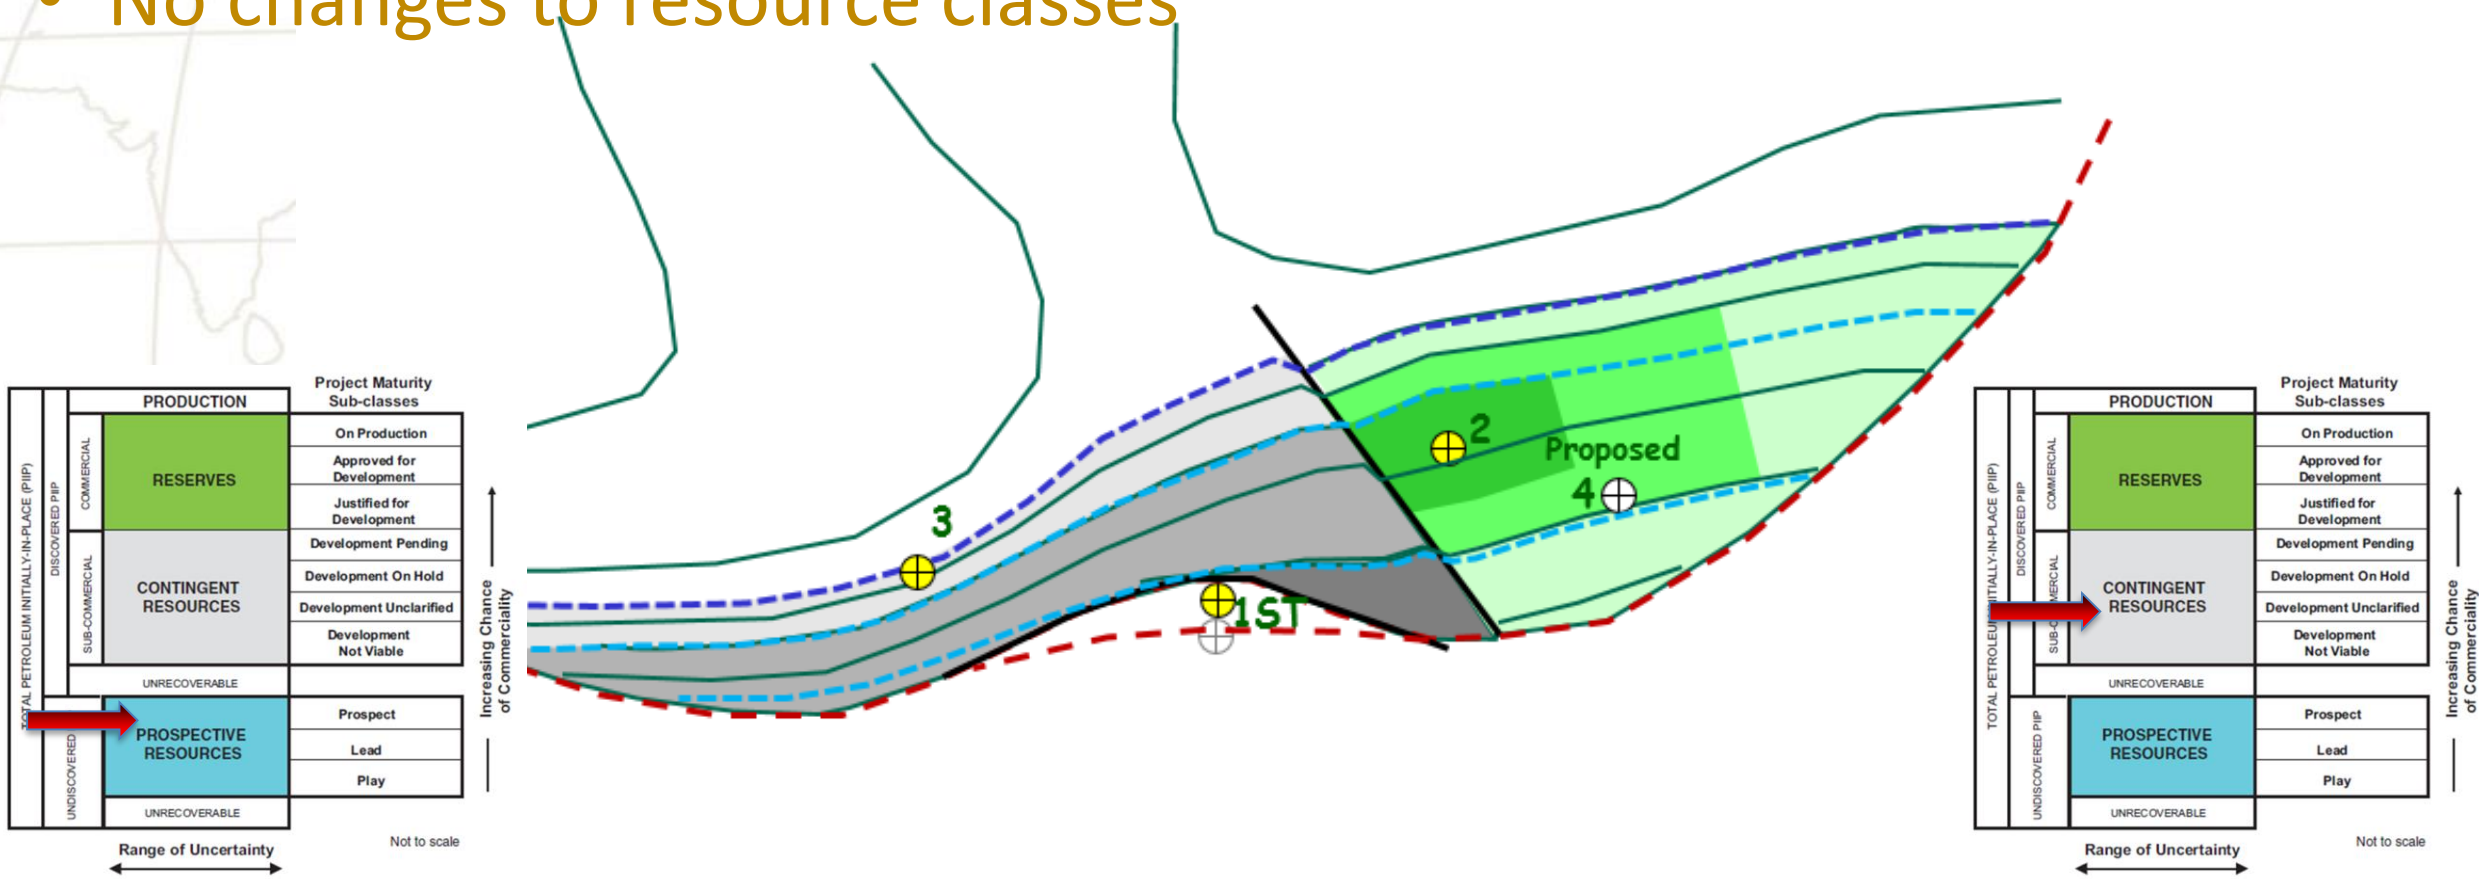

Figure 2.1—Sub-classes based on project maturity

TOTAL PETROLEUM INITIALLY-IN-PLACE (PIIP)		Project Maturity Sub-classes

	SUB-COMMERCIAL	RESERVES	Approved for Development
		CONTINGENT RESOURCES	Justified for Development
UNDISCOVERED	SUB-COMMERCIAL	UNRECOVERABLE	Development Pending
		UNRECOVERABLE	Development On Hold
	UNRECOVERABLE	UNRECOVERABLE	Development Unclassified
UNDISCOVERED	UNRECOVERABLE	PROSPECTIVE RESOURCES	Development Not Viable
		UNRECOVERABLE	Prospect
		UNRECOVERABLE	Lead
UNRECOVERABLE	UNRECOVERABLE	Play	

Figure 2.1—Sub-classes based on project maturity

AFTER THIRD WELL

- Adjustments needed to west side volume range
- No changes to resource classes

TOTAL PETROLEUM INITIALLY-IN-PLACE (PIIP)		Project Maturity Sub-classes	
		DISCOVERED PIP	UNRECOVERABLE
COMMERCIAL	PRODUCTION	On Production	
	RESERVES	Approved for Development	
		Justified for Development	
SUB-COMMERCIAL	CONTINGENT RESOURCES	Development Pending	
		Development On Hold	
		Development Unclassified	
UNDISCOVERED	PROSPECTIVE RESOURCES	Development Not Viable	
		Prospect	
		Lead	
		Play	

Range of Uncertainty

Not to scale

Figure 2.1—Sub-classes based on project maturity

TOTAL PETROLEUM INITIALLY-IN-PLACE (PIIP)		Project Maturity Sub-classes	
		DISCOVERED PIP	UNRECOVERABLE
COMMERCIAL	PRODUCTION	On Production	
	RESERVES	Approved for Development	
		Justified for Development	
SUB-COMMERCIAL	CONTINGENT RESOURCES	Development Pending	
		Development On Hold	
		Development Unclassified	
UNDISCOVERED	PROSPECTIVE RESOURCES	Development Not Viable	
		Prospect	
		Lead	
		Play	

Range of Uncertainty

Not to scale

Figure 2.1—Sub-classes based on project maturity

AFTER FOURTH WELL

- Adjustments needed to east side volume range
- Hopefully, little or no change to 1C Contingent Resources

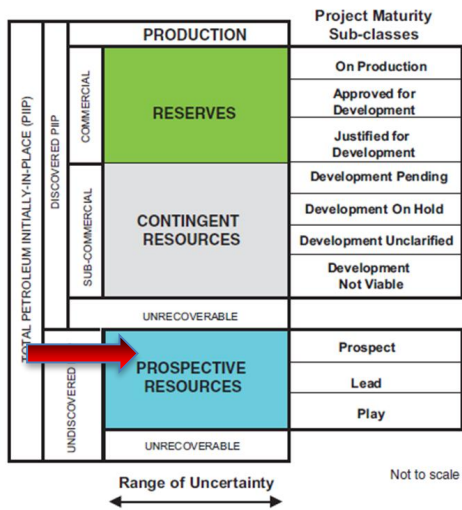

Figure 2.1—Sub-classes based on project maturity

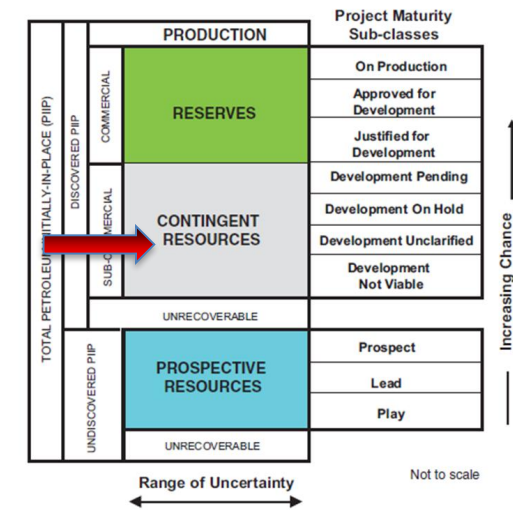

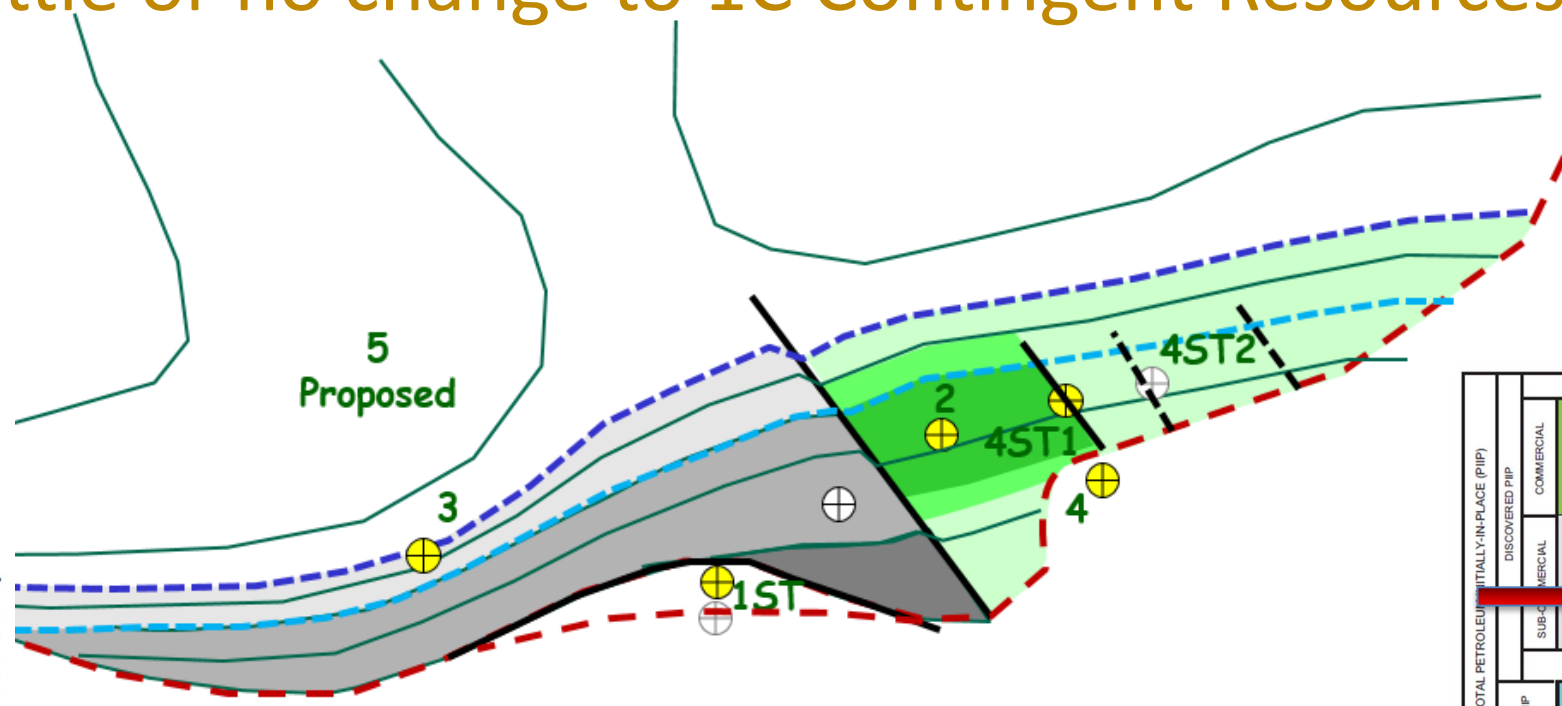

Figure 2.1—Sub-classes based on project maturity

THE FIFTH WELL – SUCCESS AGAIN

- Well 5 finds stacked, oil-charged sands similar to Well 2

- Discovery area extended, Maturity Subclasses upgraded

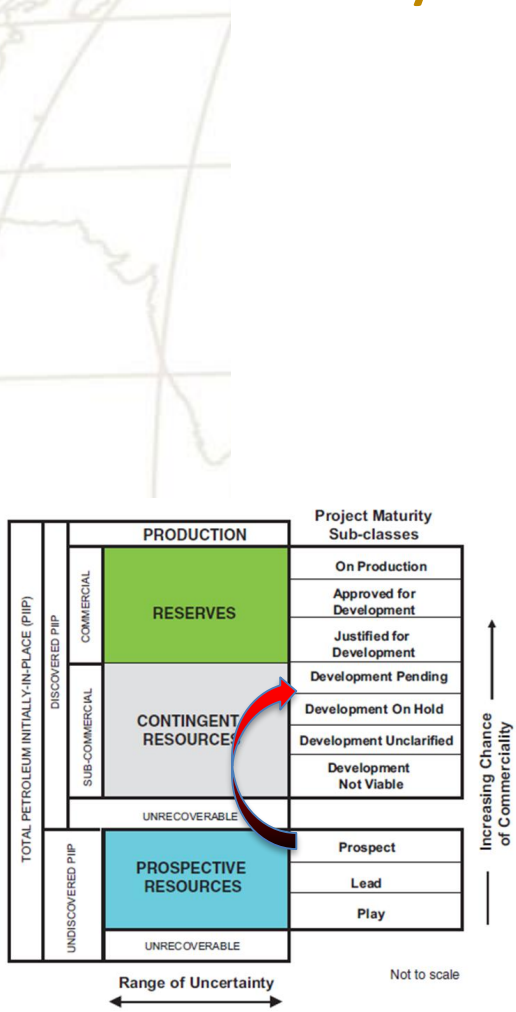

Figure 2.1—Sub-classes based on project maturity

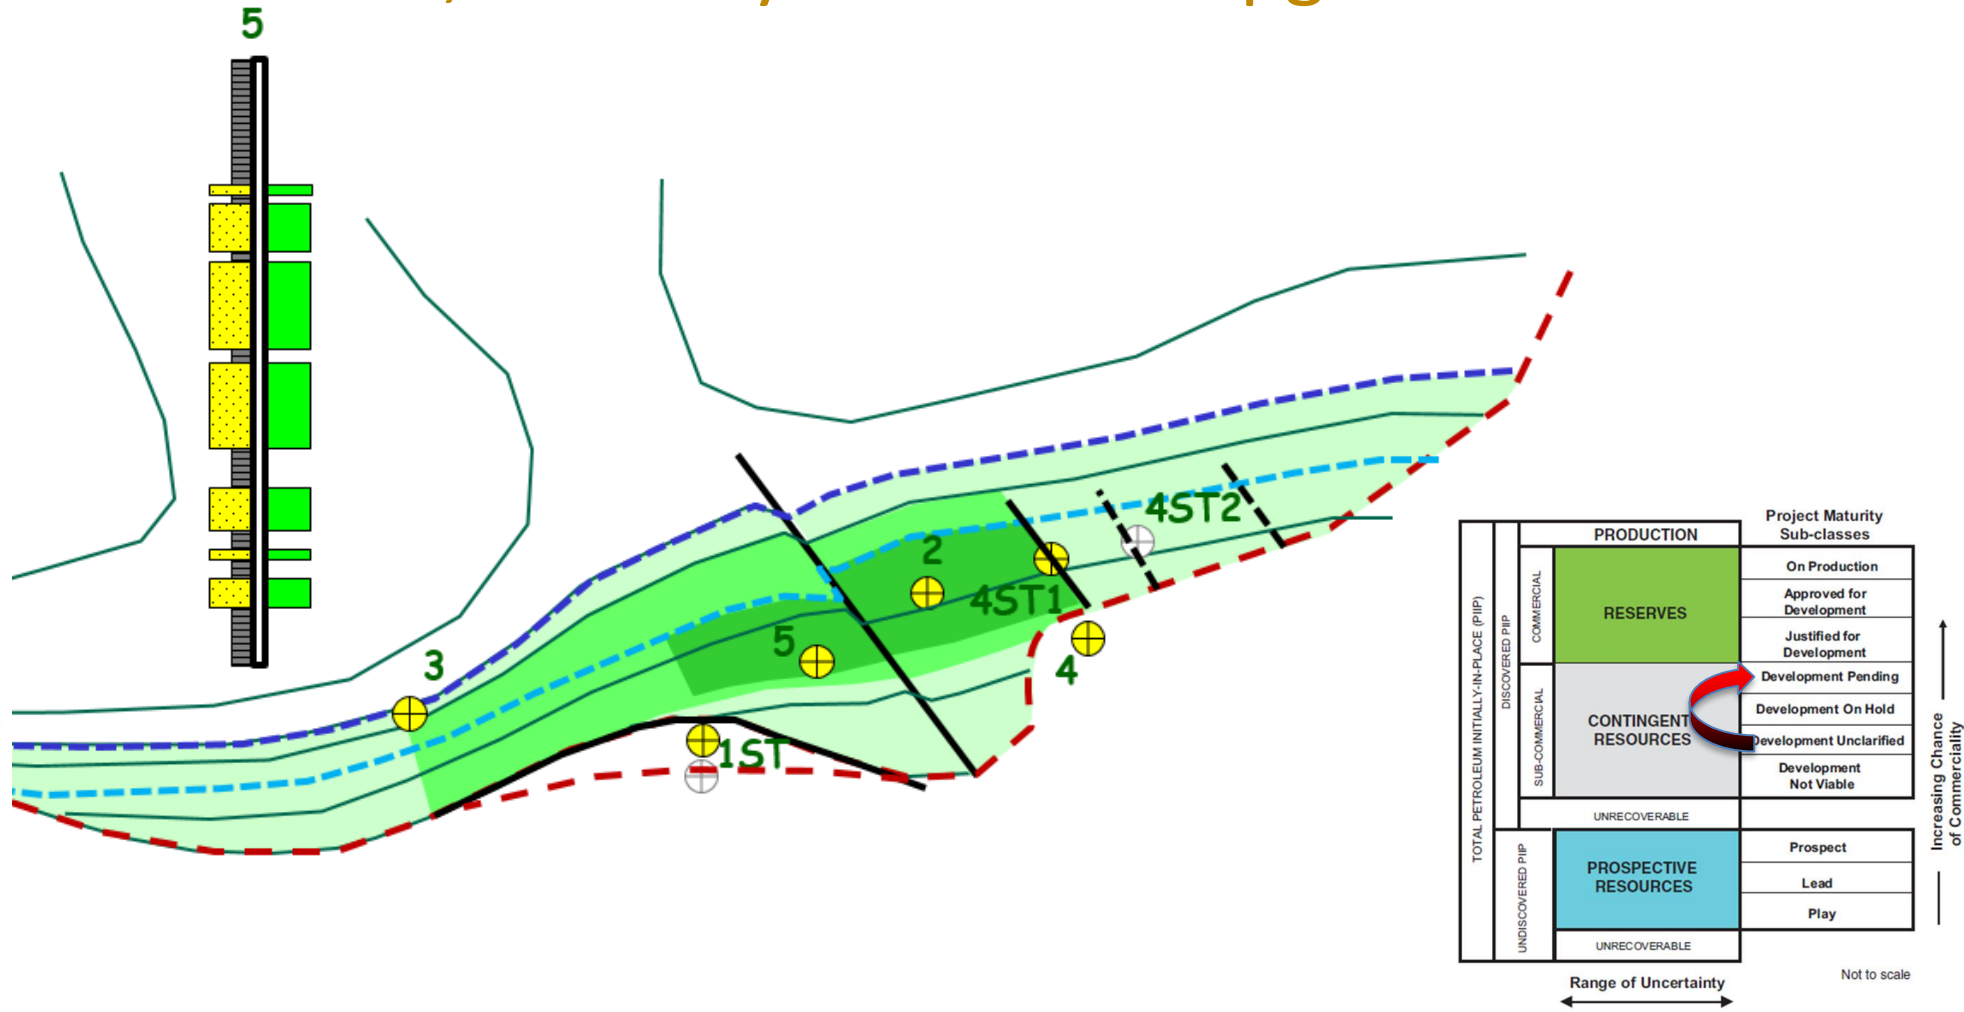

Figure 2.1—Sub-classes based on project maturity

AFTER FIFTH WELL: PUBLIC STATEMENT

This is a good approach

UPSIDE POTENTIAL – WHERE DOES IT FIT?

- Very small, unpromising finds best classified as Discovered Unrecoverable
- Potentially large, technically sound, poorly delineated areas should not be pushed into Contingent Resources – AND
- Should not be forgotten
- Transition team needed?

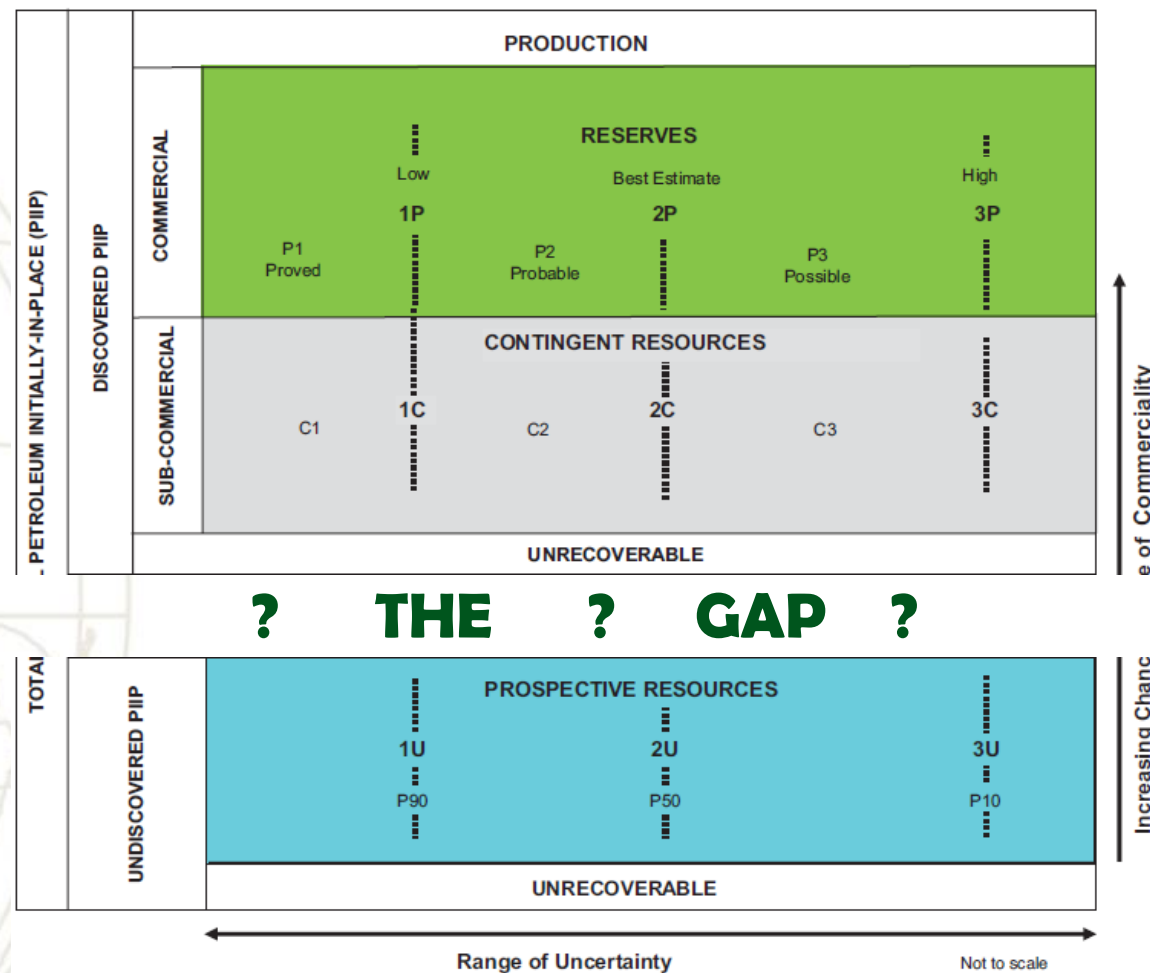

Figure 1.1—Resources classification framework

Strengths and Weaknesses of the Probabilistic Method

STRENGTHS INCLUDE

- The uncertainty range of the result can be derived from basic parameter uncertainty ranges
- Easily lends itself to numerical treatment
- Can be applied throughout the business cycle from exploration to production
- Naturally links in with value-of-information work
- Allows capture of the range of outcomes when insufficient detailed data are available

WEAKNESS INCLUDE:

- Can lead to extensive, complicated, and sometimes ineffective calculation work
-  Categories (e.g., P90, P50, P10) may not correspond to specific physical areas or volumes when simple Monte Carlo methods are used.
- The Probability Density Function of basic parameters is not always known and technical judgment has to be applied
- Dependencies between parameters are even more difficult to assess.

Adapted from: Guidelines for
Application of the Petroleum Resources
Management System, Nov 2011

- Any resource estimation method, probabilistic or deterministic, that is not associated with definitions is weaker as a decision-making tool.
- Exploration and production departments commonly have different objectives and metrics. Independent opinions can help.
- A corporate reserves group should be involved from the prospect evaluation stage onward and guide evolution of resource estimations at each step.
- Individual technical workers should be trained in resource estimation concepts and applications.

QUESTIONS
